

An EA coded from 9 written rules.

London breakout on XAUUSD M15, checked trade by trade. Verification report.

Edition 1 · October 2026 · t.me/fundedengineering

The brief. Noah sent 9 written rules and wanted an EA that does exactly that, and nothing more.

The question. Does the EA take exactly the trades its 9 written rules give, all of them and nothing more?

A separate checker expected

248

trades, written from the rules alone

The EA took

248

0 rule breaks

- **248 of 248 trades match the checker's**, with the same day, side and entry bar, in the MT5 Strategy Tester on broker A's real ticks, Jan 1, 2025 to Oct 5, 2026.
- **0 rule breaks in 7 checks**, every stop and target compared in whole points with zero tolerance, and 0 exits left undecided.
- **Run twice with the same .ex5**, the same SHA-256 in both runs: 0 different trades in the 12 fields compared for each trade.

The edge. The rules don't set the fill. In the tester's best case, with no delay added, 106 of 113 stops filled past their level. Page 5 shows where.

Backtest is a simulation of the past. No profit is promised.

What we built

An Expert Advisor for MetaTrader 5, version 1.01, that trades these rules and nothing else. All times are the broker's server time, and a day is the server date. Noah's 9 rules, word for word:

London Breakout on XAUUSD — the rules

- 1 Chart.** XAUUSD, M15 bars.
- 2 The range.** Each day, take the M15 bars that open from 03:00 up to 09:45 (both included). The range high is their highest high and the range low is their lowest low. If there is no bar in that window, there is no trade that day.
- 3 The signal.** Look at the M15 bars that open from 10:00 up to 13:45 (both included), in order. The first one that closes above the range high is a long signal. The first one that closes below the range low is a short signal. A close equal to the high or the low is not a signal. Only the first signal of the day counts.
- 4 The entry.** At market, at the first price of the bar that follows the signal bar. If that bar is on another day, there is no trade.
- 5 One trade per day.** After the first entry of the day, no other entry that day, even if the first trade is already closed.
- 6 The stop loss.** At the middle of the range: $(\text{range high} + \text{range low}) / 2$, rounded to the price's decimals, half up. If, when the trade would open, the price that triggers the stop (Bid for a long, Ask for a short) is already at the stop or past it, there is no trade.
- 7 The take profit.** Twice the stop distance, measured from the entry price. Long: $\text{entry} + 2 \times (\text{entry} - \text{stop})$. Short: $\text{entry} - 2 \times (\text{stop} - \text{entry})$.
- 8 The time exit.** A trade still open at 21:00 is closed at market at 21:00, or at the first price after 21:00 if there is none at 21:00.
- 9 Size.** 0.10 lots on every trade.

The details in rules 3, 4, 6 and 8 that a first version left open (a close equal to the range, an entry bar on another day, the rounding, an entry already past the stop, no price at 21:00) were found by the separate checker on page 3, which is written from these rules alone.

The EA's settings in this run

What the setting does	Input	Value
Range: first bar opens at this hour	RangeFromHour	3
Range: last bar opens before this hour (09:45)	RangeToHour	10
Signal: last bar opens before this hour (13:45)	SignalToHour	14
Time exit: close open trades at this hour	ExitHour	21
Take profit, in stop distances from the entry	TPMultiple	2.0
Fixed lots	Lots	0.1

The run used the EA's default values. One more input, a fixed ID the EA writes on its own orders, plays no part in the rules.

How we checked it

Not by reading the EA again, but by rebuilding every trade from the rules alone.

A separate checker. We wrote it from the 9 rules alone, without looking at the EA's code, so it rebuilds each trade from the rules, not from the EA. From the tester's 15-minute candles it rebuilt every day of the window, 643 calendar days, 454 of them with a range: the range, the first signal and the entry bar. It found 248 signals and expected 248 trades. Then it took the EA's trade list one trade at a time: the stop, the target, the 21:00 exit, the lots and, with the 1-minute candles, that no level was touched before the exit.

The candles come from a second EA of ours that never trades and only writes the candles and the symbol sheet, run in the Strategy Tester with the same settings and the same 94,846,928 ticks. They carry the highest and lowest Ask of each minute, so a short's levels are checked against the Ask that triggers them, not an estimate.

What counts as a break. Every stop and target is compared in whole points with zero tolerance: one point of difference, 0.01 USD per ounce, is a failure. The entry is checked by its bar and its time, not its price. A level touched before the exit, a stop filled better than its level or a target filled worse are failures too.

Check, one by one	Pass	Fail	Undecided
✓ Range, signal and entry bar (rules 2 to 4)	454 of 454 days with a range	0	0
✓ One trade per day (rule 5)	248 of 248 days with a trade	0	–
✓ Stop at the middle of the range (rule 6)	248 of 248 trades	0	–
✓ Target at twice the stop distance (rule 7)	248 of 248 trades	0	–
✓ Nothing open after 21:00 (rule 8)	248 of 248 trades	0	–
✓ No level touched before the exit (1-minute candles)	248 of 248 trades	0	0
✓ 0.10 lots (rule 9)	248 of 248 trades	0	–

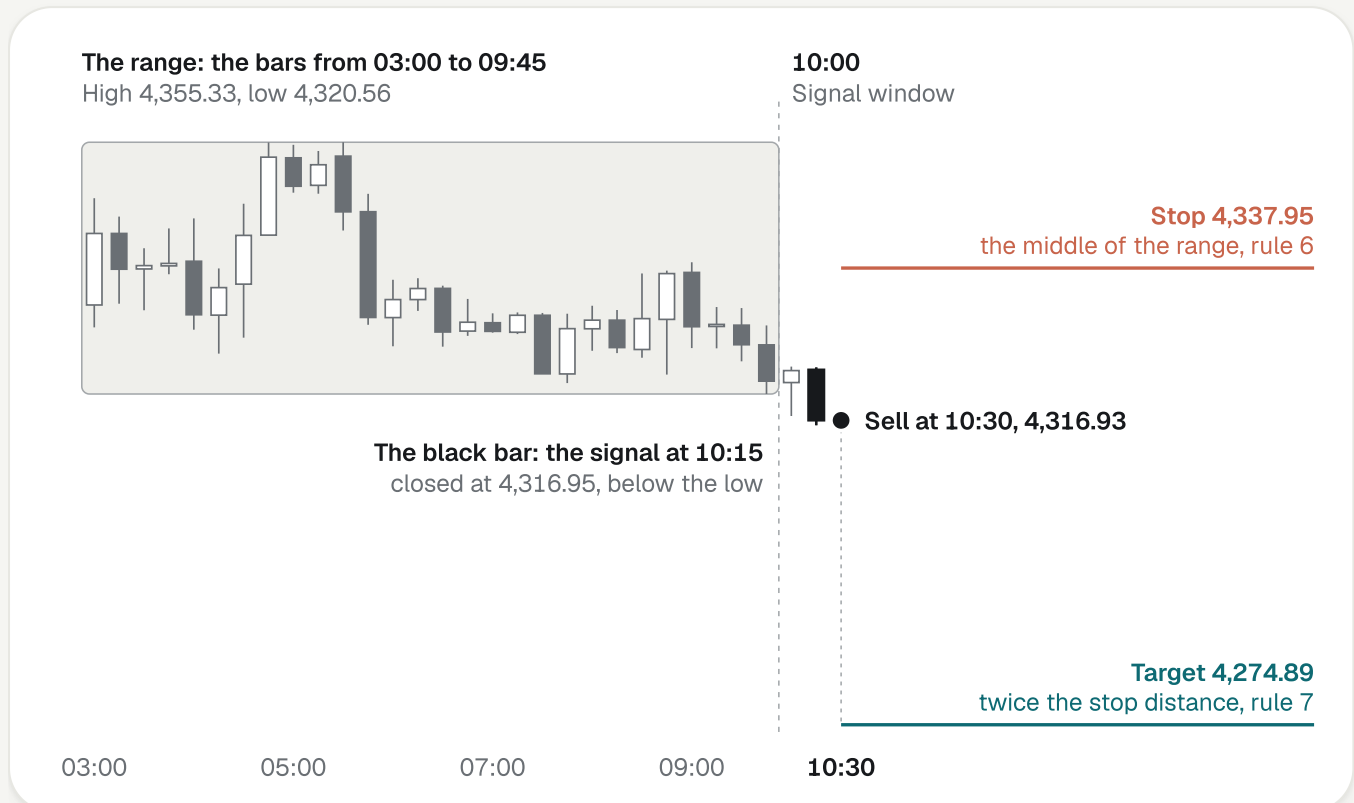

Where the rules are silent, the checker decides in writing

- The entry bar is the next bar in the data, even if a bar is missing in between. With no next bar, there is no trade.
- The middle of the range is computed in whole points as $(\text{high} + \text{low} + 1) \div 2$, rounded down: rule 6's half-up rounding without floating point.
- For a long, the price that triggers the stop at the entry is the Bid at the open of the entry bar. For a short it is the Ask, never below the Bid.
- For a short, if the lowest Ask of the entry bar's first 1-minute candle is already at the stop, there is no trade. If only the highest reaches it, the day is undecided.
- The EA must enter inside the 1-minute candle in which the entry bar's first tick arrived.
- A time exit must happen between 21:00 and the end of the first 1-minute candle at or after 21:00.
- A long's stop and target are triggered by the Bid, a short's by the Ask: the candle's highest and lowest Ask.
- For a stop or target exit, a touch in the minute of the exit or the minute before is accepted. An earlier touch is a failure. For a time exit, any touch before it is a failure.
- A stop filled better than its level, or a target filled worse, is a failure. The other way round it is measured as slippage.

Taken from the checker's code. The EA is held to them, and none of them changes a rule.

One trade, side by side

Sep 14, 2026, one of the 248. What the checker rebuilt from the candles, next to what the EA did. The chart stops at the entry.

The gray box is the range, the 15-minute bars that open from 03:00 to 09:45. The black bar is the first close outside it from 10:00, the signal. The dot is the EA's entry at the open of the next bar, with the stop and the target the EA set.

The checker, from the rules

Range high 4,355.33, low 4,320.56
Middle 4,337.95, rounded half up
Signal the 10:15 bar closed at 4,316.95, below the low
Side short
Entry bar 10:30, the next bar

The EA, from its trade list

Side sell, a short
Entry 10:30 at 4,316.93
Lots 0.10
Stop 4,337.95, the checker's middle
Target 4,274.89, which is 4,316.93 - 2 × (4,337.95 - 4,316.93)

The checker's arithmetic for this day, in whole points of 0.01

Step	In whole points	Result	The EA set	Apart
Middle of the range	$(435,533 + 432,056 + 1) \div 2$, rounded down	433,795	stop 4,337.95	0 points
Stop distance	$433,795 - 431,693$	2,102		
Target	$431,693 - 2 \times 2,102$	427,489	target 4,274.89	0 points

Each value matches to the point. The same comparison ran on all 248 trades, with the result on the checker's page. This trade's exit is in the annex with the others.

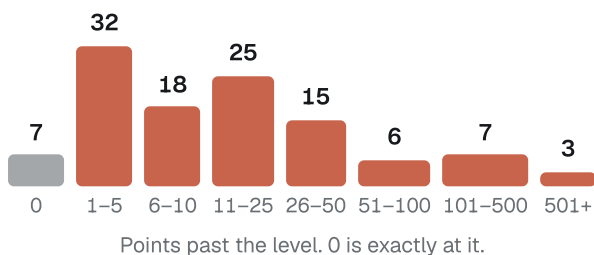

Where the stops and targets filled

The rules set the levels, not the fills. Each exit's fill price against its level, in whole points. A stop is past its level when it filled worse, a target when it filled better. At 0.10 lots one point is 0.10 USD in the MT5 tester.

Stops

106 of 113 filled worse than the level

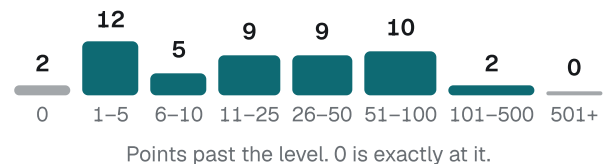

7 exactly at it. Among the 106 past it, median 11 points, 90th percentile 87, worst 1,309. In the MT5 tester the stops filled 581.90 USD worse than their levels in total.

Targets

47 of 49 filled better than the level

2 exactly at it. Among the 47 past it, median 16 points, 90th percentile 70, largest 369. In the MT5 tester the targets filled 169.10 USD better than their levels in total.

The worst stop, as the tester printed it

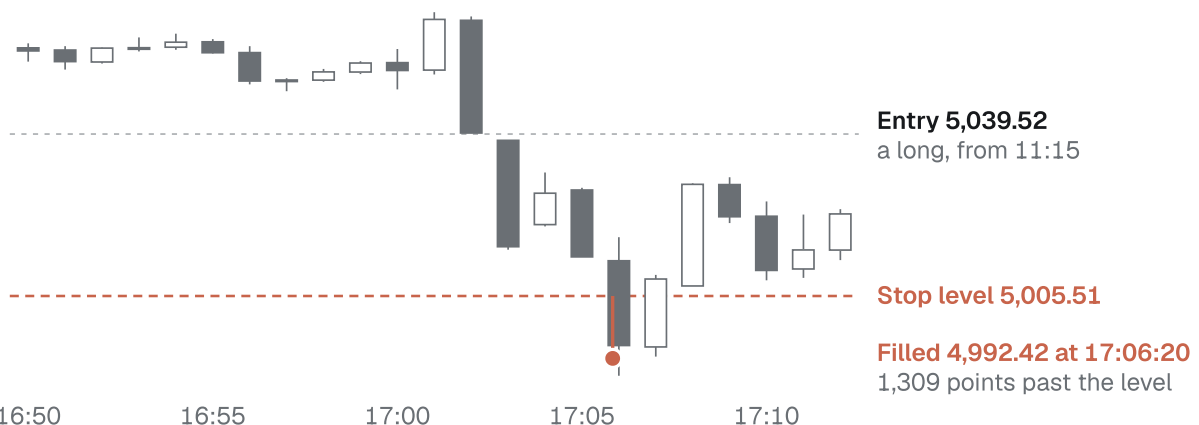

MT5 Strategy Tester report, deals as printed

Order, Commission, Swap, Profit and Balance columns cut

Time	Deal	Symbol	Type	Direction	Volume	Price	Comment
2026.02.20 11:15:00	334	XAUUSD	buy	in	0.1	5039.52	London breakout long
2026.02.20 17:06:20	335	XAUUSD	sell	out	0.1	4992.42	sl 5005.51

The comment is the stop level the EA set, 5,005.51. The price is where the tester filled it, 4,992.42: 13.09 USD per ounce past the level, 1,309 points, 130.90 USD at 0.10 lots in the MT5 tester.

Feb 20, 2026, 1-minute bars around the fill, Bid

The price fell through the level inside one minute, and the tester filled the stop at 4,992.42, at 17:06:20. All of this ran with no delay added, the tester's best case.

Limits

What this report does not show, said before anyone asks.

- **No delay added.** The tester ran with 0 ms of execution delay, its best case for execution. No run with a delay was made, and latency on a live or demo account was not measured.
- **One author.** We wrote the EA and the checker, the checker from the 9 rules alone, without looking at the EA's code. A reading of the rules both share would not show up as a break, so page 3 lists the checker's decisions where the rules are silent, for you to check.
- **One server.** Every number comes from this server, broker A's demo server, and its recorded ticks. No other server was tested.
- **Server time, not London time.** The written rules use server time, so on the 35 business days between the US and European clock changes their range and signal windows sit an hour off London time, as the rules say. Read in London time, they change the trade on 19 of them.
- **The tester only.** The EA did not run on a live or demo account.
- **No restarts.** After a restart, version 1.01 rebuilds its day from the account history and the closed 15-minute bars. A tester run never restarts the EA, so that part is not exercised here.
- **What 1-minute candles can't decide.** A stop and a target touched in the same minute, or a short whose Ask crosses the stop in the entry bar's first minute. There were 0 in this run.
- **Not a verdict on the strategy.** This report checks that the EA does what the rules say, not whether the rules are worth trading.
- **A backtest.** A simulation of the past, not a forecast. No profit is promised.

Not attached: the ticks and the candles. They are the broker's data and stay private.

The test setup

Platform	MetaTrader 5 Strategy Tester, terminal build 6230
Broker	broker A, a demo account. Its name and its server go privately
Symbol	XAUUSD, M15 bars
Model	Every tick based on real ticks, history quality 99% real ticks
Ticks and bars	94,846,928 ticks, 41,553 M15 bars
Window	Jan 1, 2025 to Oct 5, 2026, both included. The tester gets FromDate 2025.01.01 and ToDate 2026.10.06, and it leaves the ToDate out
Deposit	10,000 USD, leverage 1:500
Execution delay	0 ms
Inputs	the EA's defaults, listed with the rules
Runs	two, on Oct 11, 2026 at 11:25 and 11:26, local time of the testing machine

Files and fingerprints

The SHA-256 of the files below: the EA and the candle writer with their source code, the checker, the rules, the candles, the symbol sheet, both trade lists, the checker's output and the tester's report. Not here: the broker's ticks, which stay private, and the tester's settings file, which our run script writes for each run and deletes after it. Its recorded values are on page 6. A recompiled EA is a different binary, so two runs are the same run only with the same SHA-256.

Run twice

Both runs used the same .ex5 on terminal build 6230 and gave 248 trades each, with 0 differences in the 12 fields compared for each trade: entry time, side, lots, entry price, stop, target, exit time, exit price, exit comment, the trade's result, commission and swap, to the cent. Their two trade lists have the same SHA-256, byte for byte.

Annex: every trade

Every trade the EA took, in server time, read from the MT5 tester's report: each entry deal with its exit deal and its order's stop and target. In and Out are the entry and exit times. Entry and Exit are the fill prices. By is what closed the trade. No result column.

#	Day	Side	In	Entry	Stop	Target	Out	Exit	By
1	2025.01.02	Buy	11:15	2638.29	2630.06	2654.75	17:52	2655.31	target

Work with us

The same work, on your strategy: your rules coded into an EA, then checked the way this report shows.

Free first look, once per trader

Send your rules, any format, or just 'rules'. You get them back numbered, every gap marked, with a quote. No payment. The EA itself is paid work.

How paid work runs

- Payment by milestones.
- You test the EA on your own MT5 before the final payment.

Quote

Every project is quoted in writing for your case, after the free first look.

What we don't do

No profit promises, no signals, no decompiling. No broker or prop firm pays us.

Official contacts

Got another MT5 project? Tell us about it.

@fundedengineering

Official: this channel's DMs, @fundedengineering. Anyone else who writes to you as us isn't us. We never ask for payment before a written contract.
